LAB – 3

Project Title: Agile-Manifesto-Practice-Mapping
Project Scenario: Online Course Registration System (OCRS)

PHASE 1: UNDERSTANDING AGILE MANIFESTO

Step 1: Study Agile Manifesto Values

1. Individuals and interactions over processes and tools

Traditional approach failure:
Teams only follow strict processes and tools, so communication between team members becomes less.

Agile solution:
Agile encourages team discussions, daily meetings, and collaboration so people work together effectively.

2. Working software over comprehensive documentation

Traditional approach failure:
Too much time is spent writing documents instead of building the actual software.

Agile solution:
Agile focuses more on delivering working software quickly rather than creating long documentation.

3. Customer collaboration over contract negotiation

Traditional approach failure:
Customers are only involved at the beginning and end of the project.

Agile solution:
Agile teams interact with customers regularly and take feedback during development.

4. Responding to change over following a plan

Traditional approach failure:
Changes are difficult to make once the project plan is fixed.

Agile solution:
Agile allows teams to easily accept and implement changes dur

Step 2: Study Agile Manifesto Principles

1. Early and continuous delivery of valuable software

Teams deliver small working features frequently so customers can use them early.

2. Welcoming changing requirements

If customers request new features, the team updates the backlog and plans the change in the next sprint.

3. Frequent delivery of working software

Teams release working software after every sprint.

4. Collaboration between business stakeholders and developers

Developers and stakeholders regularly discuss requirements and progress.

5. Working software as the primary measure of progress

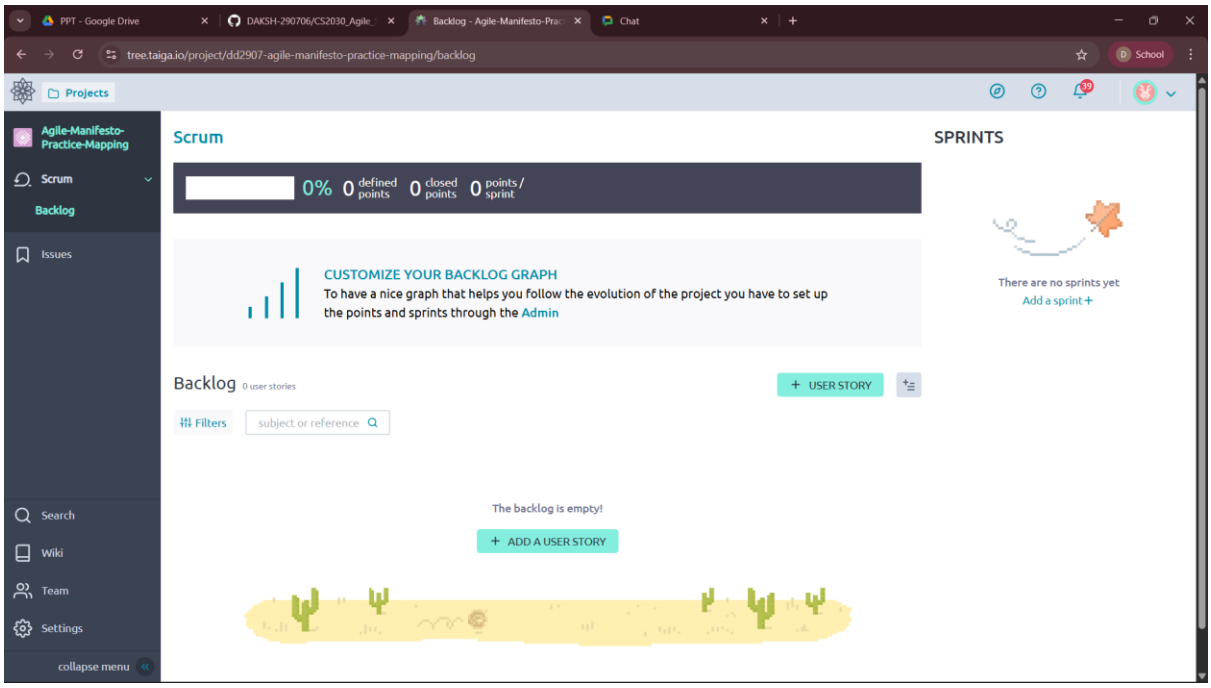
Progress is measured by completed working features instead of documentation.

6. Regular reflection and adaptation

After every sprint, the team discusses what went well and what needs improvement.

PHASE 2: MAPPING AGILE MANIFESTO TO PRACTICES USING TAIGA

Step 3: Create Agile Project in Taiga

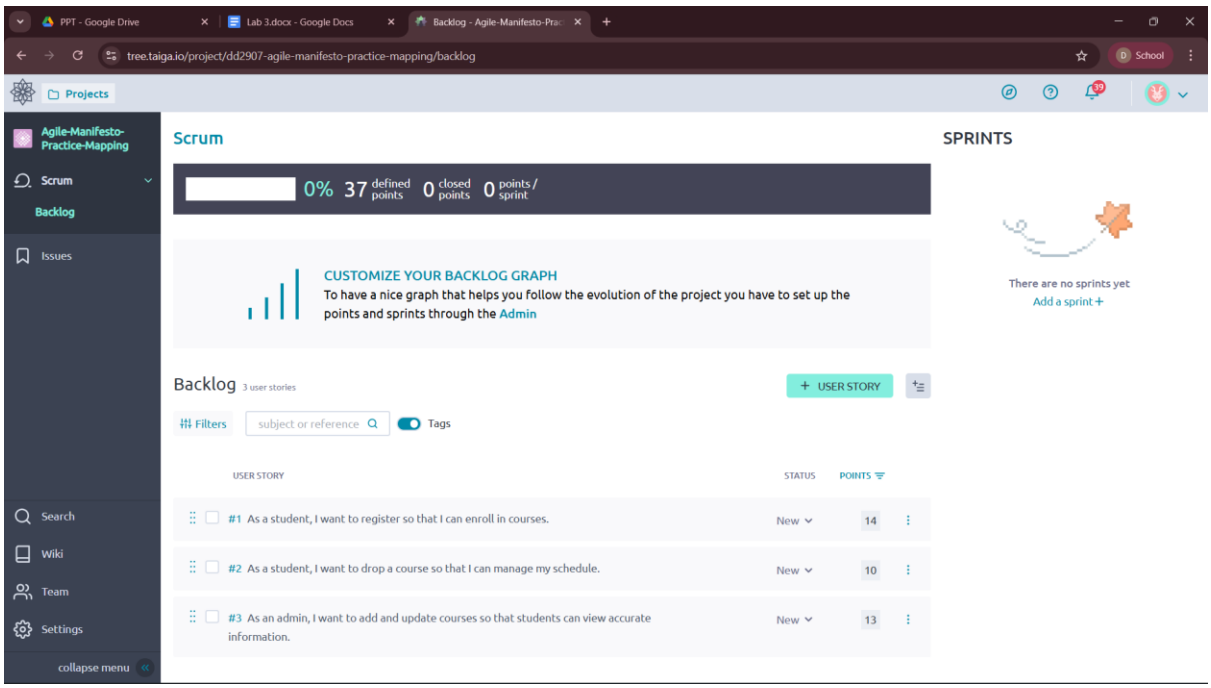


Step 4: Identify Agile Practices

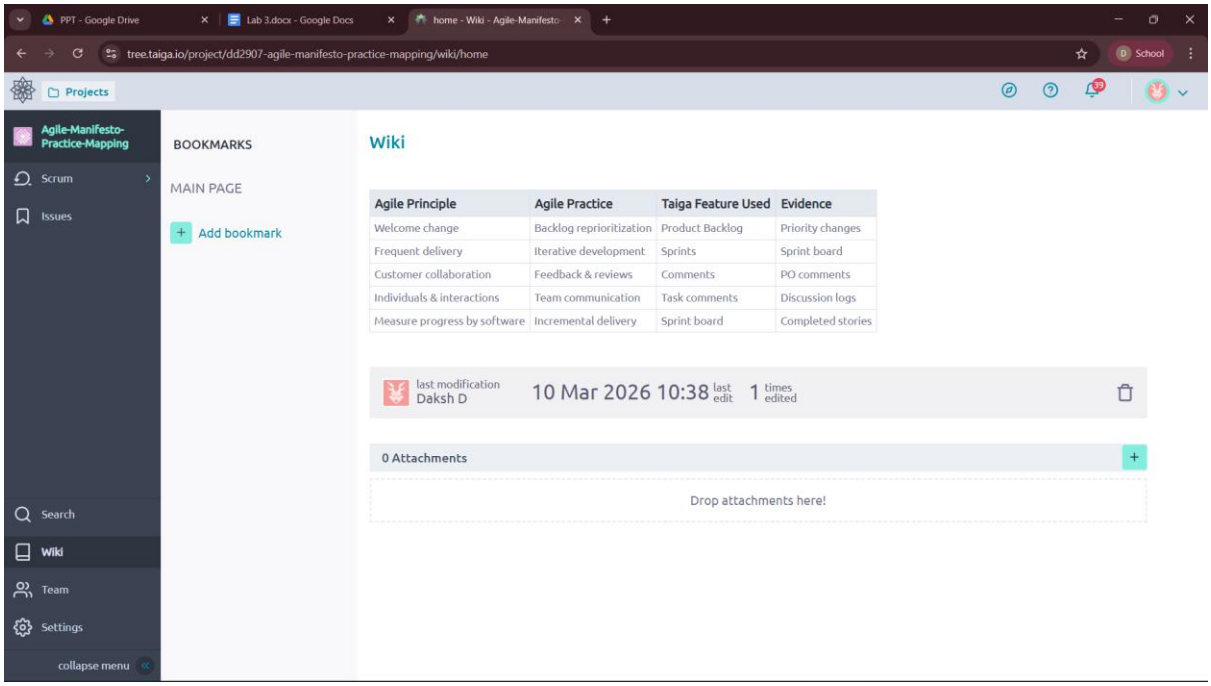
Agile Practice	Agile Principle Supported	Justification
User stories	Customer collaboration	Requirements are written from the user's perspective
Product backlog prioritization	Responding to change	Backlog items can be reordered based on new needs
Sprint development	Frequent delivery	Work is completed in short iterations
Stakeholder feedback	Collaboration	Stakeholders provide input regularly
Team communication	Individuals and interactions	Team members discuss tasks and issues

Retrospective meetings	Continuous improvement	Team reviews performance after every sprint

Step 5: Create User Stories in Taiga

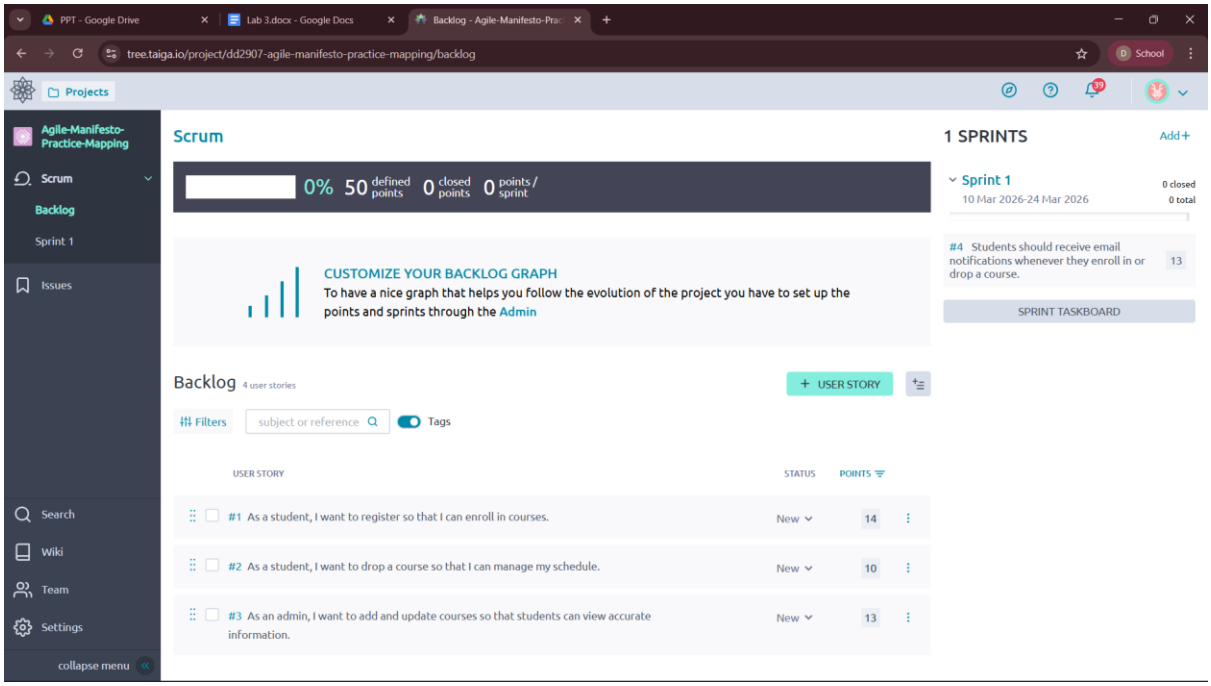


Step 6: Map Agile Principles to Taiga Features



PHASE 3: CHANGE SIMULATION & REFLECTION

Step 7: Change Simulation



Step 8: Reflection Questions

1. Which Agile principle was easiest to implement using Taiga?

The easiest Agile principle to implement using Taiga was frequent delivery of working software. Taiga provides features like sprints and sprint boards, which help teams divide work into small iterations. By completing user stories in each sprint, the team can deliver small working features regularly and track progress easily.

2. Which Agile principle was difficult to represent using a tool?

The most difficult principle to represent using a tool was individuals and interactions over processes and tools. Although Taiga provides comments and discussion features, real interaction happens through direct communication, meetings, and teamwork. A tool cannot fully replace human communication.

3. How does Taiga support collaboration and transparency?

Taiga supports collaboration and transparency by allowing all team members to see the product backlog, user stories, sprint boards, and task progress. Team members can also use comments, updates, and wiki pages to share information and discuss tasks. This makes the project progress visible to everyone in the team.

4. Can Agile values exist without tools? Justify your answer.

Yes, Agile values can exist without tools. Agile mainly focuses on team collaboration, communication, flexibility, and continuous improvement. These values depend on the people and their mindset rather than the tools they use. Tools like Taiga only help organize and manage the work, but Agile principles can still be followed even without them
